

Use Case: Submit Damage Report

Actor: Citizen Reporter

- Preconditions:
- A new report is saved with a unique ticket ID and marked "submitted".
 - the report is auto-screened and, if valid, placed in the correct department's queue.

Main Success Scenario:

1. Citizen selects "Report Damage" from home screen
2. Citizen chooses the damage type (Pothole / Streetlight / Pipeline leak/etc.)
3. Citizen takes or uploads photo of damage.
4. System reads the GPS location from the photo and shows the spot on the map
5. Citizen adds a short description and submits the report.
6. System auto-screens the report for duplicates, missing photo, and out-of-city location
7. System saves the report, generates a ticket ID, and sets status to "submitted"
8. System routes report to the matching municipal department
9. System shows a confirmation with the ticket ID
10. Use case ends successfully.

Alternate Flow - 6a. Report fails Auto-screening:

- 6a1. System detects the report is a duplicate, has no photo, or is outside the city (etc.)
- 6a2. System flags the report and does not send it to the department queue.
- 6a3. System notifies the citizen with the reason (Ex: "A report already exists for this location").
- 6a4. Citizen can edit and resubmit, or cancel. Use case ends.
